Table S1 IsoCleft (Najmanovich et al., 2008) output for (A) SPO0140 (PDB id: 2RE3) and (B) Sbal_2486 (2RA9). Nc: number of atoms in common ${ }^{1}$; TSS: Tanimoto similarity score ${ }^{2}$; Z-score ${ }^{3}$, P-value ${ }^{4}$.

| PDB id | Nc | TSS | Z-score | P-value |
| :--- | :--- | :--- | :--- | :--- |
| (A) |  |  |  |  |
| 1PWH | 37 | 0.237 | 3.25 | $2.73 \mathrm{E}-02$ |
| 1DQA | 36 | 0.211 | 3.08 | $3.39 \mathrm{E}-02$ |
| 1DM3 | 36 | 0.232 | 3.08 | $3.39 \mathrm{E}-02$ |
| 1GPE | 36 | 0.182 | 3.08 | $3.39 \mathrm{E}-02$ |
| 1V0J | 36 | 0.178 | 3.08 | $3.39 \mathrm{E}-02$ |
| 1HWY | 36 | 0.220 | 3.08 | $3.39 \mathrm{E}-02$ |
| 2VFS | 35 | 0.183 | 2.90 | $4.20 \mathrm{E}-02$ |
| 1Q6P | 35 | 0.213 | 2.90 | $4.20 \mathrm{E}-02$ |
|  |  |  |  |  |
| (B) |  |  |  |  |
| 1EEX | 35 | 0.161 | 3.46 | $5.85 \mathrm{E}-01$ |
| 1K7Y | 34 | 0.160 | 3.27 | $5.98 \mathrm{E}-01$ |
| 1U8X | 33 | 0.198 | 3.08 | $3.39 \mathrm{E}-02$ |
| 1GGE | 33 | 0.192 | 3.08 | $3.39 \mathrm{E}-02$ |
| 1TZF | 33 | 0.262 | 3.08 | $3.39 \mathrm{E}-02$ |
| 1ZPD | 33 | 0.246 | 3.08 | $3.39 \mathrm{E}-02$ |

${ }^{1}$ The number of atoms in common represents the largest subset of atoms from one cleft which are in equivalent relative geometric positions to atoms in the second cleft. Any given atom is additionally of the same atom type (hydrogen bond donor, acceptor, hydrophobic, etc) as its equivalent in the second cleft. In other words, the two clefts can be superimposed based on the detected chemical and geometric similarities.
${ }^{2}$ The Tanimoto Similarity Score is a normalized measure of similarity calculated as $\mathrm{Nc} /\left(\mathrm{N}_{\mathrm{A}}+\mathrm{N}_{\mathrm{B}^{-}}\right.$ Nc ), where Na represents the number of atoms defining the query binding site (2RE2 or 2RA9) and Nb represent that of the target binding sites present in the IsoCleft Finder Database.
${ }^{3}$ The Z-score is calculated in the standard way as $\left.(\mathrm{Nc}-<\mathrm{Nc}\rangle\right) / \mathrm{Std}(\mathrm{Nc})$, where $<\mathrm{Nc}>$ is the average number of atoms in common for the comparison of the given query cleft against the whole IsoCleft Finder Database and $\operatorname{Std}(\mathrm{Nc})$ represents the standard deviation.
${ }^{4} \mathrm{P}$-values are calculated by fitting the distribution of Z-scores to an extreme value distribution as described in (Laskowski et al., 2005).
